

# Towards the Space Governance System

## Centering the Stakeholder Values and the Circumstances of their Interactions using a Problem-Solving Approach

Space exploration and utilization is a rapidly expanding sector, and there is growing consensus that the complex space governance system must evolve with it. Faced with this dynamic nature, in this fireside chat, with leading experts in space governance, policy law and space science, we present a clear framework for conceptualizing the space governance system as a tool for discussions on space law and policy, demystifying its structure and the actors, instruments, and collaborations within it. We then consider key debates in the space policy field within this framework from a global and transdisciplinary perspective.
