Dyslexia is a condition which most people understand as children swapping letters or reading slowly. Dyslexia is, however, a developmental disorder that may be based on audiovisual processing problems and affects about 15% of English speakers. A thorough analysis of the mistakes from a person with Dyslexia helps to determine the individual level of written language processing skills.

In this workshop, we will explore the theoretical background of dyslexia, as well as present a wide variety of classroom and course strategies to help and support dyslexic learners.
