Dr. Dorman has dedicated his life to the study of cochlear implants. The cochlear implants have made it possible for more than 325,000 people worldwide to function in the acoustic world. Dr. Dorman is retiring after 40 years of service to Arizona State University.

In his “last lecture”, Dr. Dorman will be discussing “Neural plasticity, cross-modal reorganization and the voice of a cochlear implant: Studies with single-sided deaf patients”.

The Cochlear Implant Laboratory investigates the aspects of speech, voice and music perception by patients fit with cochlear implants and by normal-hearing subjects listening to simulations of cochlear implants.

Join us on Friday, April 29th to hear Dr. Dorman lecture as part of the Coffee & Cognition discussion group.
